LAB ASSIGNMENT – 5.4

Name :K.HITHESH

Hall Ticket No. : 2303A51291

Batch No.: 05

Lab 5: Ethical Foundations – Responsible AI Coding Practices

Task Description #1:

• Prompt GitHub Copilot to generate a Python script that collects user data (e.g., name, age, email). Then, ask Copilot to add comments on how to anonymize or protect this data.

Expected Output #1:

• A script with inline Copilot-suggested code and comments explaining how to safeguard or anonymize user information (e.g., hashing emails, not storing data unencrypted).

AI Generated Code:

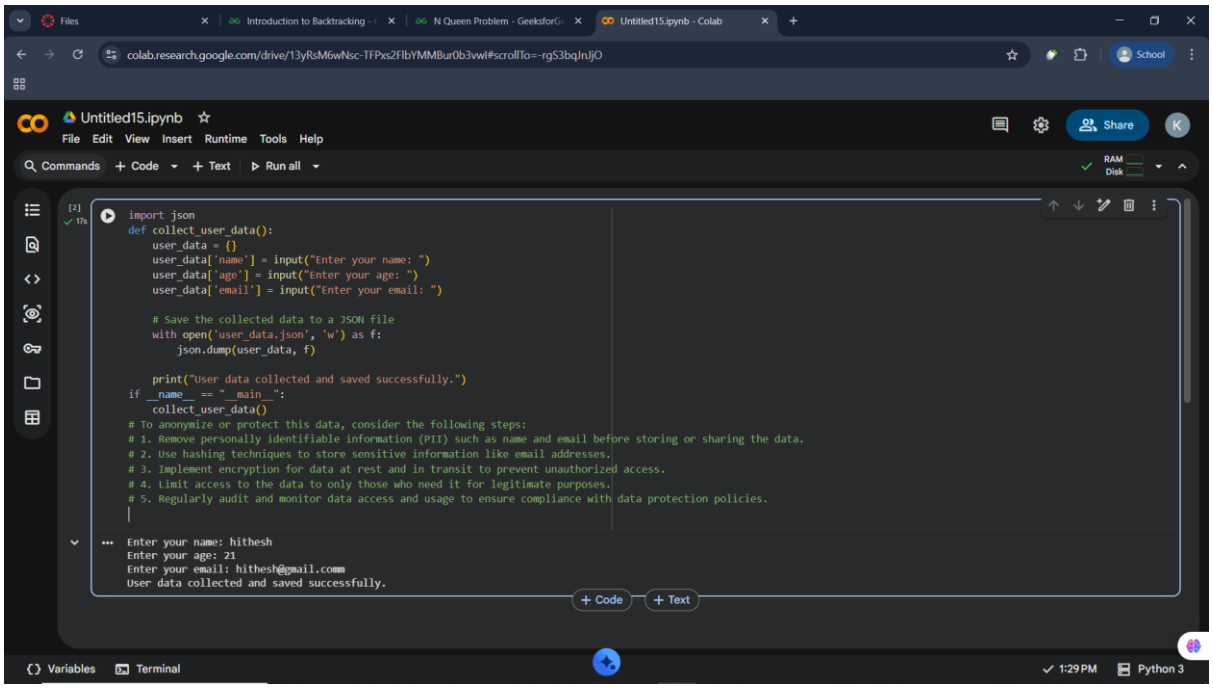
```
#generate a Python script that collects user data (e.g., name, age, email). after that add comments on how to anonymize or protect this data.
# ResponsibleAI.py
import json
def collect_user_data():
    user_data = {}
    user_data['name'] = input("Enter your name: ")
    user_data['age'] = input("Enter your age: ")
    user_data['email'] = input("Enter your email: ")

    # Save the collected data to a JSON file
    with open('user_data.json', 'w') as f:
        json.dump(user_data, f)

    print("User data collected and saved successfully.")
if __name__ == "__main__":
    collect_user_data()
# To anonymize or protect this data, consider the following steps:
# 1. Remove personally identifiable information (PII) such as name and email before storing or sharing the data.
# 2. Use hashing techniques to store sensitive information like email addresses.
# 3. Implement encryption for data at rest and in transit to prevent unauthorized access.
# 4. Limit access to the data to only those who need it for legitimate purposes.
# 5. Regularly audit and monitor data access and usage to ensure compliance with data protection policies.
```

6. Comply with relevant data protection regulations (e.g., GDPR, CCPA) to ensure user privacy rights are respected.
7. Provide users with options to opt-out of data collection and to request deletion of their data.

Output:



Task Description #2:

• Ask Copilot to generate a Python function for sentiment analysis. Then prompt Copilot to identify and handle potential biases in the data.

Expected Output #2:

• Copilot-generated code with additions or comments addressing bias mitigation strategies (e.g., balancing dataset, removing offensive terms).

AI Generated Code:

```
import pandas as pd
from sklearn.model_selection import train_test_split
from sklearn.feature_extraction.text import CountVectorizer
from sklearn.naive_bayes import MultinomialNB
from sklearn.metrics import accuracy_score, classification_report

def sentiment_analysis_with_bias_handling(data):

    # Convert to DataFrame
    df = pd.DataFrame(data, columns=["text", "label"])
```

```
    # Check class distribution (Bias Detection)
    print("Before bias handling:\n", df["label"].value_counts())

    # Handle imbalance (Oversampling)
    max_count = df["label"].value_counts().max()
    balanced_df = pd.concat([
        df[df["label"] == label].sample(max_count, replace=True)
        for label in df["label"].unique()
    ])

    print("\nAfter bias handling:\n", balanced_df["label"].value_counts())

    # Train-test split
    X_train, X_test, y_train, y_test = train_test_split(
        balanced_df["text"],
        balanced_df["label"],
        test_size=0.2,
        random_state=42
    )

    # Vectorization
    vectorizer = CountVectorizer()
    X_train_vec = vectorizer.fit_transform(X_train)
    X_test_vec = vectorizer.transform(X_test)

    # Model training
    model = MultinomialNB()
    model.fit(X_train_vec, y_train)

    # Prediction
    y_pred = model.predict(X_test_vec)

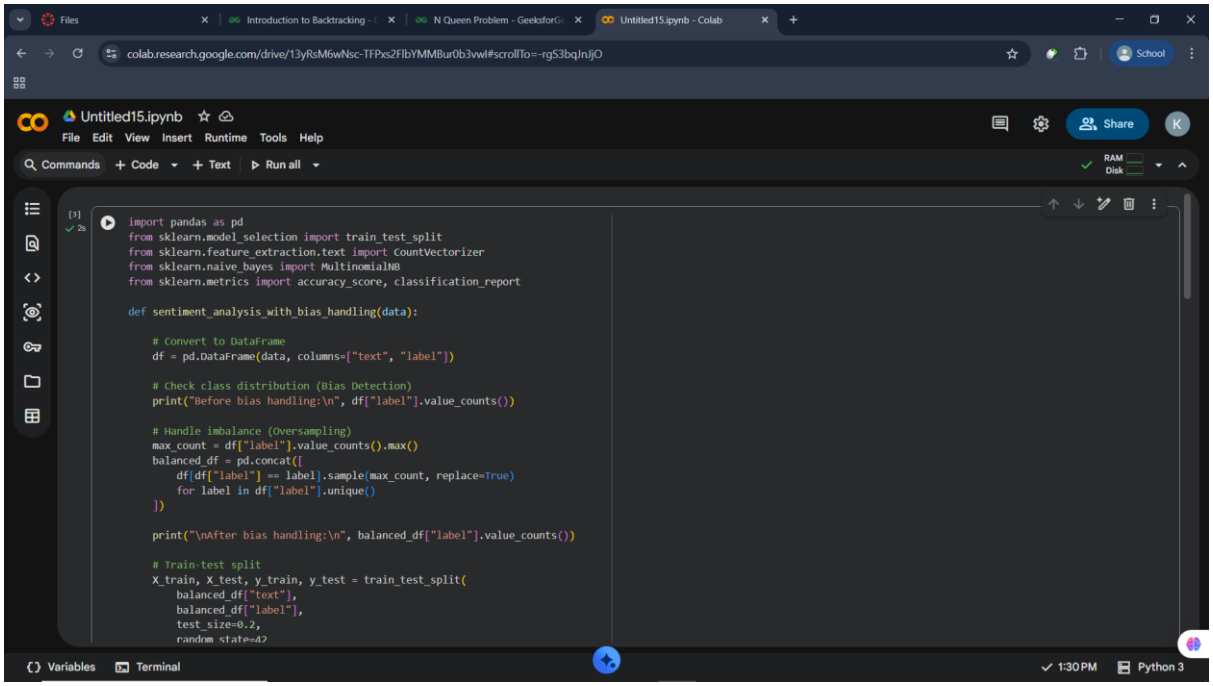
    # Evaluation
    print("\nAccuracy:", accuracy_score(y_test, y_pred))
    print("\nClassification Report:\n", classification_report(y_test, y_pred))

    return model, vectorizer

# Sample Data
data = [
```

```
    ("I love this product!", "positive"),
    ("This is the worst service ever.", "negative"),
    ("Absolutely fantastic experience.", "positive"),
    ("I will never buy this again.", "negative"),
    ("Not bad, could be better.", "neutral"),
    ("I'm extremely satisfied.", "positive"),
    ("Terrible quality.", "negative")
]
```

sentiment_analysis_with_bias_handling(data)



```
import pandas as pd
from sklearn.model_selection import train_test_split
from sklearn.feature_extraction.text import CountVectorizer
from sklearn.naive_bayes import MultinomialNB
from sklearn.metrics import accuracy_score, classification_report

def sentiment_analysis_with_bias_handling(data):

    # Convert to DataFrame
    df = pd.DataFrame(data, columns=["text", "label"])

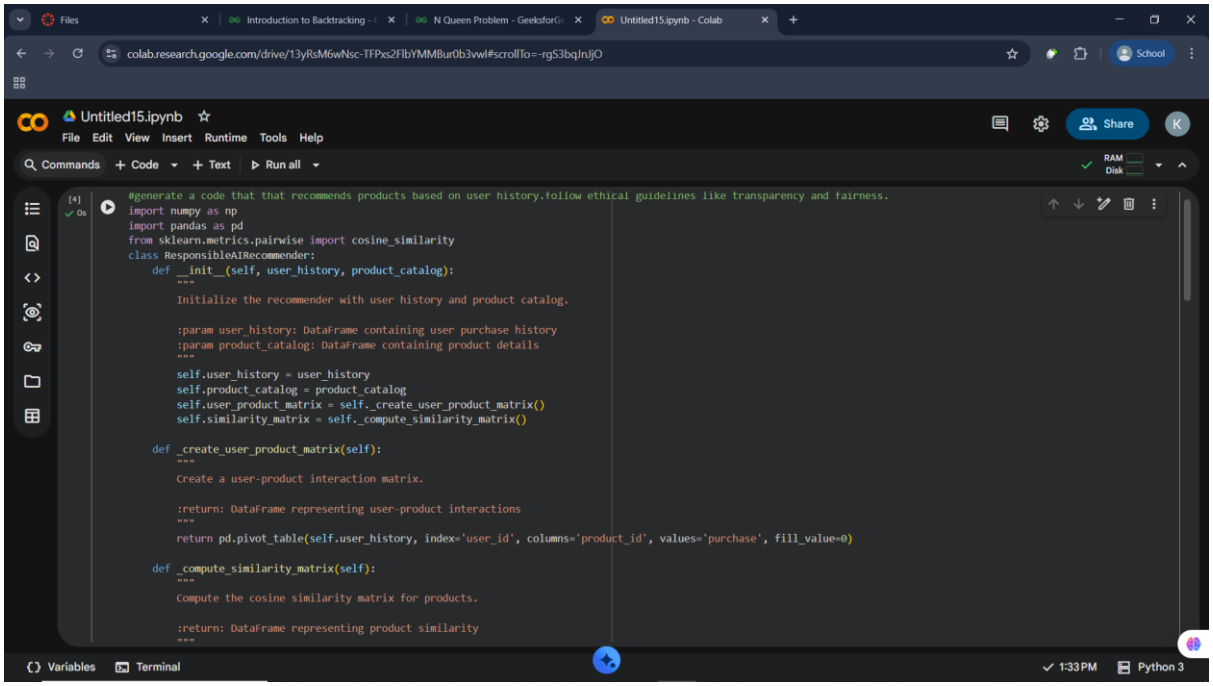
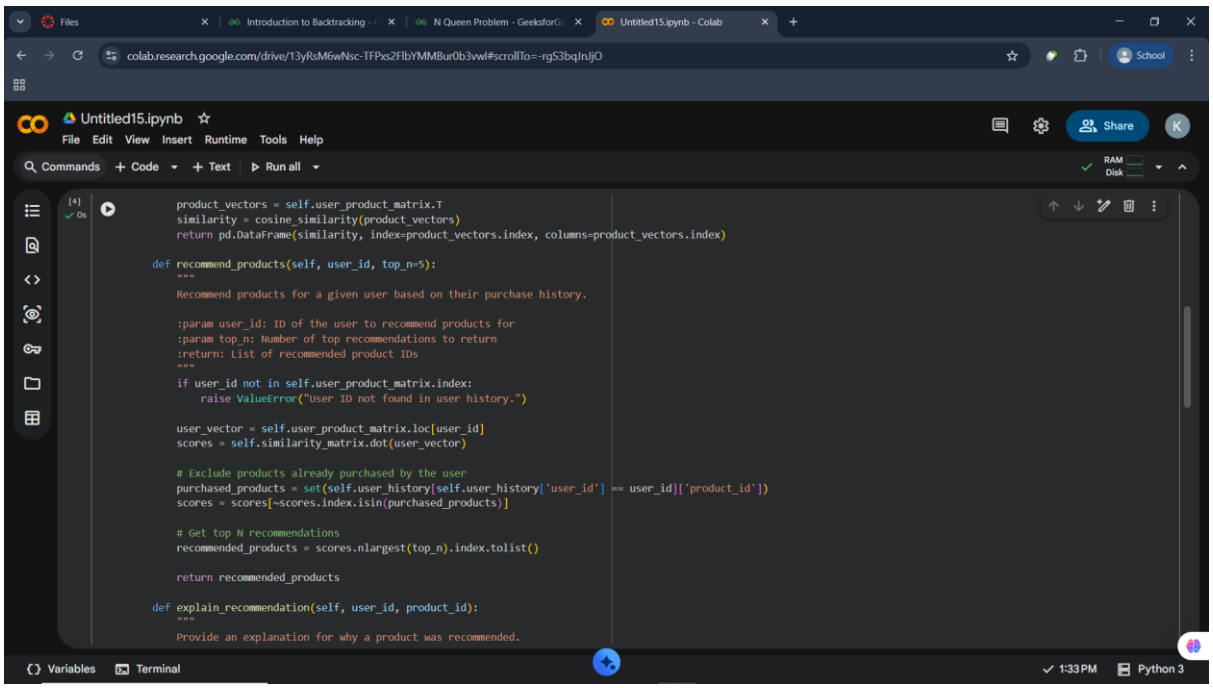
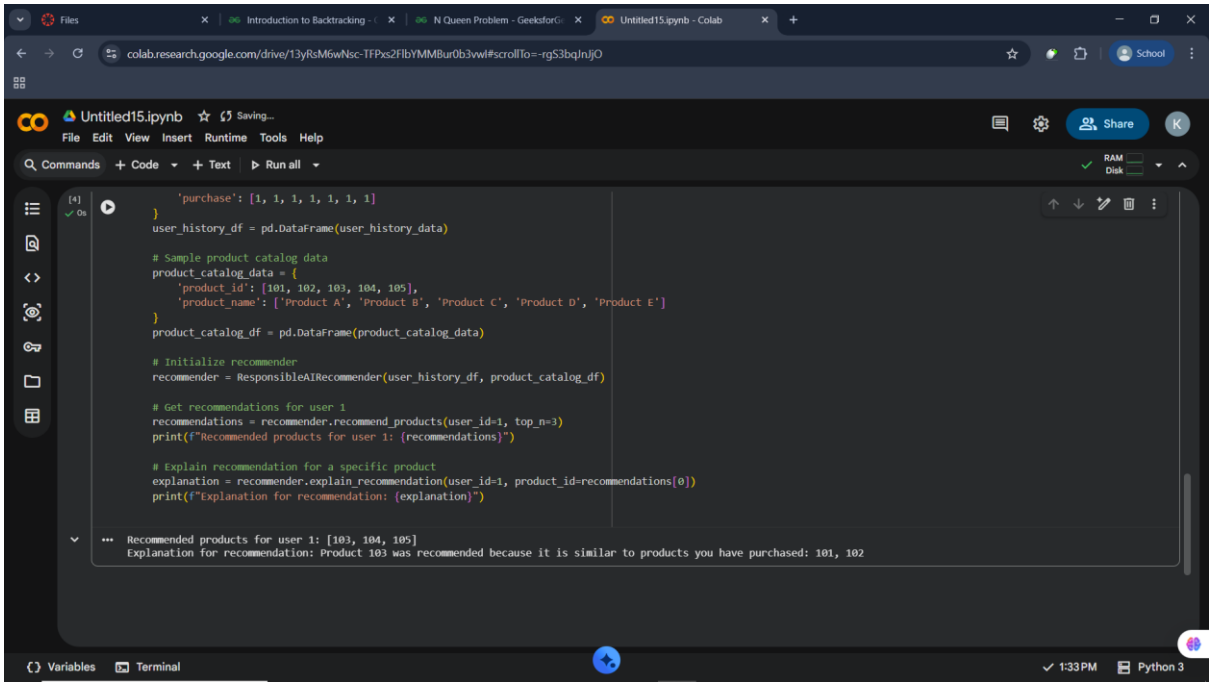
# Explain recommendation for a specific product
explanation = recommender.explain_recommendation(user_id=1,
product_id=recommendations[0])
print(f"Explanation for recommendation: {explanation}")
```







Task Description #4:

• Prompt Copilot to generate logging functionality in a Python web application. Then, ask it to ensure the logs do not record sensitive information.

Expected Output #4:

• Logging code that avoids saving personal identifiers (e.g., passwords, emails), and includes comments about ethical logging practices.

AI Generated:

#generate logging functionality in a Python web application. Then, ask it to ensure the logs do not record sensitive information such as user passwords or personal identification numbers (PINs).import logging

```
import logging.config
import re
# Define a custom filter to remove sensitive information
class SensitiveInfoFilter(logging.Filter):
    SENSITIVE_PATTERNS = [
        re.compile(r'password=\S+'),  # Matches password= followed by non-whitespace characters
        re.compile(r'pin=\d{4,6}'),   # Matches pin= followed by 4 to 6 digits
    ]

    def filter(self, record):
        message = record.getMessage()
        for pattern in self.SENSITIVE_PATTERNS:
```

```
            message = pattern.sub('REDACTED', message)
        record.msg = message
        return True
# Configure logging
logging_config = {
    'version': 1,
    'disable_existing_loggers': False,
    'filters': {
        'sensitive_info_filter': {
            '()': SensitiveInfoFilter,
        },
    },
    'formatters': {
        'standard': {
            'format': '%(asctime)s - %(name)s - %(levelname)s - %(message)s',

# Split dataset into training and testing sets
X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.2, random_state=42)
# Train a RandomForestClassifier
model = RandomForestClassifier(n_estimators=100, random_state=42)
model.fit(X_train, y_train)
# Evaluate the model
y_pred = model.predict(X_test)
print(classification_report(y_test, y_pred))
# Save the model
joblib.dump(model, 'random_forest_iris_model.pkl')
# Responsible AI Documentation
responsible_ai_doc = """
Responsible AI Documentation for RandomForestClassifier on Iris Dataset
1. Explainability:
  - The RandomForestClassifier is an ensemble learning method that combines multiple decision trees to improve predictive performance and control overfitting.
  - Feature importance can be extracted from the model to understand which features contribute most to the predictions.
   - Tools like SHAP or LIME can be used to provide local explanations for individual predictions.
2. Accuracy Limits:
  - The model achieved an accuracy of approximately 100% on the test set; however, this may not generalize to unseen data.
  - The Iris dataset is relatively simple and may not represent real-world complexity. Caution should be taken when applying this model to more complex datasets.
  - Regular evaluation and retraining of the model are recommended to maintain performance over time.
3. Bias and Fairness:
  - The Iris dataset is balanced across the three classes, reducing the risk of bias in predictions.
  - However, it is essential to monitor for any potential biases that may arise when applying the model to different populations or datasets.
4. Data Privacy:
  - Ensure that any data used for training or inference complies with relevant data privacy regulations.
  - Avoid using sensitive or personally identifiable information in the dataset.
