

LAB ASSIGNMENT – 5.4

Name :K.HITHESH

Hall Ticket No. : 2303A51291

Batch No.: 05

Lab 5: Ethical Foundations – Responsible AI Coding Practices

Task Description #1:

- Prompt GitHub Copilot to generate a Python script that collects user data (e.g., name, age, email). Then, ask Copilot to add comments on how to anonymize or protect this data.

Expected Output #1:

- A script with inline Copilot-suggested code and comments explaining how to safeguard or anonymize user information (e.g., hashing emails, not storing data unencrypted).

AI Generated Code:

#generate a Python script that collects user data (e.g., name, age, email). after that add comments on how to anonymize or protect this data.

```
# ResponsibleAI.py
```

```
import json
```

```
def collect_user_data():
```

```
    user_data = {}
```

```
    user_data['name'] = input("Enter your name: ")
```

```
    user_data['age'] = input("Enter your age: ")
```

```
    user_data['email'] = input("Enter your email: ")
```

```
# Save the collected data to a JSON file
```

```
with open('user_data.json', 'w') as f:
```

```
    json.dump(user_data, f)
```

```
print("User data collected and saved successfully.")
```

```
if __name__ == "__main__":
```

```
    collect_user_data()
```

```
# To anonymize or protect this data, consider the following steps:
```

```
# 1. Remove personally identifiable information (PII) such as name and email before storing or sharing the data.
```

```
# 2. Use hashing techniques to store sensitive information like email addresses.
```

```
# 3. Implement encryption for data at rest and in transit to prevent unauthorized access.
```

```
# 4. Limit access to the data to only those who need it for legitimate purposes.
```

```
# 5. Regularly audit and monitor data access and usage to ensure compliance with data protection policies.
```

7. Provide users with options to opt-out of data collection and to request deletion of their data.

Output:

Task Description #2:

- Expected Output #2:**

- ### AI Generated Code:

# Save the model
joblib.dump(model, 'random_forest_iris_model.pkl')

# Responsible AI Documentation
responsible_ai_doc = """
```

Responsible AI Documentation for RandomForestClassifier on Iris Dataset

1. Explainability:

- The RandomForestClassifier is an ensemble learning method that combines multiple decision trees to improve predictive performance and control overfitting.
- Feature importance can be extracted from the model to understand which features contribute most to the predictions.
- Tools like SHAP or LIME can be used to provide local explanations for individual predictions.

2. Accuracy Limits:

- The model achieved an accuracy of approximately 100% on the test set; however, this may not generalize to unseen data.
- The Iris dataset is relatively simple and may not represent real-world complexity. Caution should be taken when applying this model to more complex datasets.

- Regular evaluation and retraining of the model are recommended to maintain performance over time.

3. Bias and Fairness:

- The Iris dataset is balanced across the three classes, reducing the risk of bias in predictions.
- However, it is essential to monitor for any potential biases that may arise when applying the model to different populations or datasets.

4. Data Privacy:

- Ensure that any data used for training or inference complies with relevant data privacy regulations.
- Avoid using sensitive or personally identifiable information in the dataset.

ResponsibleAI.py > ...
29 - The model achieved an accuracy of approximately 100% on the test set; however, this may not generalize to new data.
30 - The Iris dataset is relatively simple and may not represent real-world complexity. Caution should be taken when applying the model to more complex datasets.
31 - Regular evaluation and retraining of the model are recommended to maintain performance over time.
32 3. Bias and Fairness:
33 - The Iris dataset is balanced across the three classes, reducing the risk of bias in predictions.
34 - However, it is essential to monitor for any potential biases that may arise when applying the model to more complex datasets.
35 4. Data Privacy:
36 - Ensure that any data used for training or inference complies with relevant data privacy regulations.
37 - Avoid using sensitive or personally identifiable information in the dataset.
